How Administrations work!

The Wake-up Alarm : As the alarm clock rings, the little hammer (1) oscillates, so that the little saw (2) attached to it cuts the string tied to the bed post, so that weight (3) falls into the receptacle (4) which swings down under the weight so that the perpendicular arm (5) swings up, and the match stick attached to it burns by rubbing against the rough surface (6) and ignites the wick of the little rocket (7), so that as the rocket takes off, the knife (8) swings down to cut the string holding the pivoted old army boot (9) filled with hardened Portland cement, and the boot swings down and catches the sleeper's posterior (10) in mid swing.*

* The Administrative Warning – "sleeping facing the boot is injurious...".
