How Administrations work!

The Candle Extinguisher : As the push button (1) is pressed, the gasoline engine of an Indian automobile (2) is fired*, so that the rich exhaust gases escape through the exhaust pipe (3) into the rubber bladder (4) thereby inflating it, which causes the lower arm (5) to dip down, and the needle (6) attached to the arm punctures the bag releasing a rich mixture of CO and CO₂ towards the candle, making its continued combustion increasingly difficult, and at the same time the upper arm (7) presses on the play button of the cassette – player (8), so that a pre-recorded news item of yet another safe landing of the Domestic Airlines flight is played, and the man heaves a sigh of relief (9) with such intensity that the candle (10) is firmly extinguished.

* A choke is optional as an accessory
