

How Administrations work!

The Egg Boiler : As soon as the hen (1) lays the egg*, it is carried down the padded slide (2) and dropped into the container full of water (3), so that some of the water spills over the frog (4) seated on the greased ramp (5), whereupon the frog imagining the monsoon to have set in, jumps with joy, and manages to kick against the switch of the heater (6) turning it on and at the same time pulls the stick (7) which is tied to its left hind leg, shutting the container closed, and as the water starts boiling and the egg is boiled, enough steam pressure builds inside the container so that it is released at a high pressure from the tight nozzle (8) which in turn drives the pivoted device (9) clockwise, which presses the switch (10) turning the heater off.

* As to why the hen should lay the egg at the appointed place, the question belongs to the realm of the famous hen and egg problem.
